Experiment No.8
Implementation of Views and Triggers.
Date of Performance:
Date of Submission:

Aim :- Write a SQL query to implement views and triggers

Objective :- To learn about virtual tables in the database and also PLSQL constructs

Theory:

SQL Views:

In SQL, a view is a virtual table based on the result-set of an SQL statement.

A view contains rows and columns, just like a real table. The fields in a view are fields from one or more real tables in the database.

You can add SQL statements and functions to a view and present the data as if the data were coming from one single table.

A view is created with the CREATE VIEW statement.

CREATE VIEW syntax

CREATE VIEW view name AS

SELECT column1, column2, ...

FROM table name

WHERE condition;

SQL Updating a View

A view can be updated with the CREATE OR REPLACE VIEW statement.

SQL CREATE OR REPLACE VIEW Syntax

CREATE OR REPLACE VIEW view name AS

SELECT column1, column2,...

FROM table name

WHERE condition;

SQL Dropping a View

A view is deleted with the DROP VIEW statement.

SQL DROP VIEW syntax

DROP VIEW view name;

Trigger: A trigger is a stored procedure in the database which automatically invokes whenever a special event in the database occurs. For example, a trigger can be invoked when a row is inserted into a specified table or when certain table columns are being updated.

Syntax:

```
create trigger [trigger name]
[before after] {insert
update delete} on [table
name] [for each row]
[trigger body]
```

Explanation of syntax:

1. create trigger [trigger name]: Creates or replaces an existing trigger with the trigger name.
2. [before after]: This specifies when the trigger will be executed.
3. {insert update delete}: This specifies the DML operation.
4. on [table name]: This specifies the name of the table associated with the trigger.
5. [for each row]: This specifies a row-level trigger, i.e., the trigger will be executed for each row being affected.
6. [trigger_body]: This provides the operation to be performed as trigger is fired

Implementation:

SQL View:

1) Create View:

```
create view productinfo as
select product_id,product_name,price,stock_quantity
from products;
select *from product_info
```

1 08:54:52 create view productinfo as select product_id,product_name,price,stock_... 0 row(s) affected 0.000 sec

Vidyavardhini's College of Engineering and Technology

Department of Artificial Intelligence & Data Science

96 • `select *from product_info`

Result Grid | Filter Rows: | Export: | Wrap Cell Content: |

	product_id	product_name	price
▶	1	Ball	30.00
	2	Bat	100.00
	3	Stumps	800.00
	4	Helmet	850.00

Result Grid

2) Drop View:

```
drop view if exists product_info;
select * from product_info;
```

3 08:57:55 drop view if exists product_info 0 row(s) affected 0.000 sec

SQL Trigger:

```
CREATE TRIGGER lcase_insert BEFORE INSERT ON products FOR EACH ROW
SET NEW.product_name = UPPER(NEW.product_name);
insert into products(product_id,product_name,price,stock_quantity)
values('79','hand golves','670','90');
select * from products;
```

Result Grid | Filter Rows: | Edit: | Export/Import: | Wrap Cell Content: |

	product_id	product_name	price	stock_quantity	category	supplier_name
	7	Bat	100.00	50	Category 2	NULL
	8	Stumps	800.00	300	Category 3	NULL
	9	Helmet	850.00	200	Category 4	NULL
	10	Kneepads	500.00	700	Category 5	NULL
	79	HAND GLOVES	670.00	90	NULL	NULL
*	NULL	NULL	NULL	NULL	NULL	NULL

Conclusion:

1. Brief about the benefits for using views and triggers.

Ans.: Views simplify queries, enhance security, abstract table structures, and optimize performance. Triggers enforce data integrity, audit changes, enforce business logic, and support replication.

Department of Artificial Intelligence & Data Science

2. Explain different strategies to update views.

Ans.: Updating views can be done directly, by updating base tables, using triggers, or by recreating views. These methods offer varying degrees of control and are applied based on the view's complexity and update requirements.
